# Dr Tapas Ralar Roll No. $\begin{aligned} & \text { National Institute of Technology Hamirpur } \\ & \text { Department of Chemical Ensinerino }\end{aligned}$ Department of Chemical Engineering 

End Semester Examination, May 2023
Branch: Chemical Engineering Course Code: CH-323
Course Title: Process Equipment Design-II
Class: B. Tech. | Semester: VI | Full Marks: 50 | Time: 3 hours

## Instructions:

- Answer all the questions. All parts ( $a, b, c$ ) of any question must be answered in same place.
- Data book is to be supplied in the examination hall.
- Calculator is allowed but exchange of the same is not permitted.
- Missing data may suitably be assumed, if any.

1. It is necessary to preheat $149000 \mathrm{lb} / \mathrm{h}$ of $34{ }^{\circ} \mathrm{API}$ crude oil from $170^{\circ} \mathrm{F}$ to $285^{\circ} \mathrm{F}$. There is a utility of $33^{\circ} \mathrm{API}$ gas-oil line running near the tower at 530 ${ }^{\circ} \mathrm{F}$. The temperature of the gas-oil from the exchanger should not be less than $300^{\circ} \mathrm{F}$. Available on the site is a $1-6$ shell and tube heat exchanger having tubes of 1 " OD, $13 \mathrm{BWG}, 16^{\prime}$ long arranged on a 1.25 " triangular pitch layout. The baffles ( $25 \%$ cut segmental) are spaced at 5 " apart. A pumping head of 10 psi is allowable on both sides. It is preferable to pass the crude oil through the tube.
Given: Thermal conductivity of tube (steel) $=29 \mathrm{BTU} / \mathrm{h} . \mathrm{ft} .{ }^{\circ} \mathrm{F}$.
Assume overall heat transfer coefficient $=55 \mathrm{BTU} / \mathrm{h} . \mathrm{ft}^{2} .{ }^{\circ} \mathrm{F}$.
a) Calculate the heat duty of the exchanger.
b) Determine Shell ID.
c) Calculate shell-side heat transfer coefficient. Neglect the viscosity correction factor.
d) Calculate dirt factor if the tube-side heat transfer coefficient based on outside surface area is $160 \mathrm{BTU} / \mathrm{h} . \mathrm{ft}^{2 .}{ }^{\circ} \mathrm{F}$.
2. In a distillation process, feed containing $5 \mathrm{~mol} \%$ ethanol in water is concentrated to $50 \%$. The concentration of alcohol in the bottom stream is reduced to less than $0.1 \%$. Design a sieve plate column to perform this separation, for a feed rate of $10,000 \mathrm{~kg} / \mathrm{h}$ at $20^{\circ} \mathrm{C}$ temperature. The column will operate at 1 atm . (top plate). A pressure drop of 1.25 kPa per plate is allowed. A tray spacing of 0.5 m and $80 \%$ flooding at maximum gas flow rate is suggested. Assume minimum liquid flow as $70 \%$ of the maximum rate both above and below the feed plate. Mass balance of the column gives the following data for top section.
Given: Downcomer area (both top and seal) $=10 \%$ of column cross-sectional area; Hole diameter $=$ Plate thickness $=12 \mathrm{~mm}$; Height of weir $=40 \mathrm{~mm}$; Hole area $=10 \%$ of active area; Downcomer apron area $=0.0131 \mathrm{~m}^{2}$.

| Parameters | Top section |
| :--- | :--- |
| Number of plates | 3 |
| Vapour flow rate | $86.0 \mathrm{kmol} / \mathrm{h}$ |
| Liquid flow rate | $35.42 \mathrm{kmol} / \mathrm{h}$ |
| Density of the liquid | $866.0 \mathrm{~kg} / \mathrm{m}^{3}$ |
| Column top temperature | $80^{\circ} \mathrm{C}$ |
| Average Mol. wt. of vapour | 36.7 |
| Average Mol. wt. of liquid | 32.0 |
| Surface tension | $40 \times 10^{-3} \mathrm{~N} / \mathrm{m}$ |

a) Calculate column diameter for the top section (take the nearest value as per IS: 2844-1964 for subsequent calculations).
b) Calculate the total pressure drop per plate assuming maximum weir crest is 20 mm liquid height.
c) Calculate downcomer residence time.
3. A single effect evaporator is employed to concentrate $20000 \mathrm{lb} / \mathrm{h}$ of feed from $20 \%$ to $50 \%$ aqueous solution of NaOH . The saturated steam is available at 34.7 psi and the pressure of the evaporator is 1.93 psi . The overall heat transfer coefficient is estimated to be $250 \mathrm{BTU} / \mathrm{h} . \mathrm{ft}{ }^{2}{ }^{\circ} \mathrm{F}$. The feed temperature is $100^{\circ} \mathrm{F}$. Neglect boiling point elevation.
Given: Enthalpy of feed and thick liquor are 55 and $221 \mathrm{BTU} / \mathrm{lb}$, respectively and specific heat of feed and thick liquor may be taken as 1 .
a) Calculate the amount of steam consumed.
b) Estimate the steam economy.
c) Determine the heat transfer area required.
4. a) What are the advantages of floating head heat exchanger?
b) What are the possible ways to decrease pressure drop in the tube side for a shell and tube heat exchanger?
c) What is the role of calming zone in sieve plate distillation column?
d) Explain flooding and weeping in a mass transfer column.
e) Write down the energy balance equation for condensing fluid where superheated vapour is entering as feed and sub-cooled liquid is leaving as condensate. Draw a concentration profile.
f) Why $(1 / 2)$ factor is required for calculation of pressure drop of the boiling fluid in a reboiler?
